Gross margin at liberalized generation and supply in the Iberian market rose by 32% YoY to 368.6m in 9M06, showing significant improvement in 3Q06 vs. previous quarters, following the increase of installed capacity (Ribatejo CCGT new group of 400MW since 4Q05), higher load factors due to the absence of material stoppages in 3Q06, and higher gross margin per MWh sold, due to lower costs with CO2 emissions and reduction of sales at low prices to liberalized retail customers. In 3Q06 our liberalized generation plants in Iberia produced 5,275GWh, a 12.6% YoY growth vs. 3Q05. Excluding technical programmed stoppages, in 9M06 our coal plants portfolio continued to show the highest load factor in the Iberian market while load factor of our CCGTs portfolio was fully in line with Iberian market average.

Volume of electricity sold to liberalized customers in Iberian market fell to 2,261GWh in 3Q06, a 18% decline vs. 2Q06 and a 31% decline vs. 3Q05. This declining trend in volume is explained by the current strong competition of the low regulated retail tariffs in Portugal and Spain, which led EDP to opt to transfer part of its liberalized electricity sales to more attractive wholesale markets.

PPAs contracted gross margin rose by 0.1% YoY to 703.9m in 9M06, continuing to be key contribution to EDP's stable cash flow profile and to the high level of predictability of wholesale electricity tariffs in Portugal in the 9M06. Our PPA contracts with the Portuguese regulated electricity system represented 65% of our Iberian generation & supply gross profit vs. a 70% weight in 9M05.

Distribution in Portugal: the negative tariff deviation between tariffs paid by regulated customers and system costs continued to increase in 3Q06 but by a smaller amount than in 2Q06. Operating costs of this business area fell by 4% YoY, supported on lower commercial costs (such as invoicing and posting) staff reduction (less 178 employees) and lower costs with pension fund liabilities, leading to a 16% YoY increase of EBITDA to 370m in 9M06.

EBITDA of electricity distribution in Spain rose 13.5% YoY in 9M06. **In 3Q06, HC managed to purchase electricity for its regulated customers at prices considerably below the average purchase costs of Spanish distributors as a whole,** more than compensating the extra-costs imposed by the intragroup assimilated bilateral agreement at 42.35 imposed by the RD03/06.

Gross margin of electricity distribution in Brazil in 3Q06 continued to be penalized by negative tariff deviations between tariffs received and system costs which should be recovered in the following annual tariff revisions. Nevertheless, the 16.67% tariff increase at Escelsa in the beginning of August and a recovery in electricity demand at the Enersul concession area have already lead to the creation of a

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

lower amount of tariff deviation in 3Q06 than in the previous 2Q06. In generation, the start of operations of the Peixe Angical hydro plant (1st group started in Jun-06, plant fully operational from Sep-06 onwards) provided a 113% growth YoY in 9M06 of EBITDA from generation.

Our wind generation gross Installed capacity reached 1,237MW in Sep-06 fully in line with our pipeline rollout plans, and EBITDA from Neo rose by 136% YoY to Eur105m in 9M06. We have now 422MW of wind farms under construction from which 217MW are expected to enter into operation in 2006, which would allow us to reach a 1,454MW capacity in line with the targets previously announced.

Net financial costs decreased from 230m in 9M05 to 22.9m in 9M06. Note that **9M06 financial results include a positive 166.9m contribution from REN's net profit** which in 3Q06 includes a capital gain from the disposal of REN's 18.3% stake in Galp. Net interest costs in 9M06 rose by 14% YoY reflecting the increase of the average cost of debt from 4.2% in 9M05 to 4.4% 9M06.

Net debt in Set-06 stood at 9,354m, fully in line with Jun-06 and below the 9,463m figure as at Dec-05. Taking into account the 6.5% increase in capex to 901m in 9M06 and the need to fund the 317m increase of negative tariff deviations in Spain, Brazil and Portugal in the period (total amount of regulatory receivables in Sep-06 was Eur859m), net debt stability reflects the strong free cash flow capacity of the group.

Table of Contents**EBITDA Overview: Consolidated EBITDA up 25.4%**

EBITDA (m)	9M2006	9M2005	Δ 06/05
IBERIAN MARKET			
Generation & Supply	824.0	771.2	6.8%
NEO - Renewable Energy	105.1	44.5	136.3%
Cogeneration	13.1	17.6	-25.3%
Distribution	406.8	349.8	16.3%
Gas	104.4	77.0	35.5%
Brazil	298.6	273.4	9.2%
Telecoms	8.5	15.5	-45.2%
Other & Adjustments	(84.6)	(212.4)	60.2%
Consolidated	1,676.0	1,336.7	25.4%

Iberian Generation and Supply: EBITDA benefit from i) the change from a short-position in generation-supply in Portugal to a long-position in 9M2006, as a result of the start up of Unit III of Ribatejo CCGT in 4Q2005 and a reduction of the number of liberalised clients in Portugal; and ii) the increase of the net selling price (after TPA tariffs), both in Portugal and Spain. This was partly offset by i) the negative impact of the RD 3/2006, which withdraws the right to CO2 allowances attributed to generators under the Spanish NAP, for the amounts equivalent to January and February 2006 emission licences (- 22m) and for the amounts not sold through bilateral contracts between March and September 2006 (- 24m); and ii) the lower availability of the Spanish power plants over 1H2006 as a result of programmed stoppages.

NEO - Renewable Energy: EBITDA more than doubled reflecting the substantial investments EDP made during 2005 and 9M2006 (namely the acquisition of Desa in Spain in 4Q2005), which increased consolidated wind installed capacity more than two fold to 943 MW (or 1.237 MW gross installed capacity).

Distribution in Iberia: EBITDA increased 16.3% following a 5.1% rise in gross profit and a 1.6% reduction in operating costs. The distribution activity in Iberia benefit: i) in Portugal, from the increase in consumption, a 10% increase of the allowed revenues and a 21.5m reduction in operating costs; and ii) in Spain, from a 2.5% increase in regulated revenues and a 4.7m positive impact from deviations on the cost of electricity purchased. Such performance was partly offset: i) in Portugal, by a higher tariff difference to be recovered, 126.9m in 9M2006 vs. 70.7m in 9M2005; and ii) in Spain, by the application of the RD 3/2006 which modified the settlement mechanism in the system, only recognising a price of 42.35/MWh on the energy purchased by the distributors, made simultaneously with the generation sales within the same group (- 15.5m).

Gas in Iberia: EBITDA increased 35.5% following the change in the consolidation method of Portgás (full consolidation in 9M2006; equity method in 9M2005) or 6.7% on a pro-forma base. In 3Q2006, Naturgas managed to fully benefit from the attractive liberalized gas market in Spain, which more than compensated losses with procurement costs in 1Q2006.

Brazil: EBITDA benefit from the start-up of Peixe Angical hydro power plant (452 MW), a 4% growth in consumption at our DisCos. concession areas and the 16% appreciation of the Brazilian Real against the Euro. Nevertheless, this performance was offset by non-recurrent figures, such as the higher non-controllable costs than those recognised in retail tariffs (to be recovered through tariffs in the next annual adjustments) and one-off costs with the ongoing staff reduction plan, which will reduce 16% of the number of employees of Energias do Brasil until Dec-07.

Other: The change in the other & adjustments is mainly due to a 150m provision booked in the 9M2005 related to the Spanish tariff deficit. In the 9M2006 the tariff deficit (154m) did not have an impact in the P&L, considering that the current legislation assures the recovery of the tariff insufficiency in Spain.

Consolidated: Excluding the provision related to the Spanish tariff deficit in 9M2005, EBITDA would have increased 12.8% in 9M2006.

EDP Group	900.6	845.6	6.5%

Consolidated Capex amounted to 900.6m in the 9M2006, up 6.5% YoY, reflecting a 33.0% increase in capex at our Iberian core business. It is worth mentioning, on one hand, that about 47% of EDP Group's capex related to the expansion of installed capacity, namely in new wind farms, in a new CCGT in Spain and in the Peixe Angical hydro power plant in Brazil. These investments will enable the medium term growth of our business. On the other hand, about 74% of EDP Group 9M2009 capex was related to regulated businesses, which present a low risk of return on the investment, such as renewable energies, Iberian electricity and gas distribution and generation under PPA.

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

Iberian Generation and Supply The decline of Capex from generation business in Portugal reflects the end of construction of both Venda Nova II hydro plant (192MW Aug05 with PPA until 2027) and of Ribatejo III CCGT (392MW 4Q2005). In Spain, EDP continued the construction works of the 400 MW Castejón II CCGT, which is expected to start operations in 4Q2007. In Sept-06 accumulated works in progress at Castejón II amounted to 109m. By the end of 2006, EDP will start the construction works of another 400 MW CCGT, which will be located at Soto and that is expected to start operations in 2008. Additionally, in 9M2006, EDP invested 53.4m to reduce the SO₂ and NO_x emissions at Sines, Aboño and Soto coal fired power plants, in order to comply with EU large combustion plants directive by Dec07.

NEO Renewables In the 9M2006, NEO's capex in wind farms amounted to 191.2m. In Portugal, NEO invested 65.2m, which are mostly related to wind farms that are expected to enter into operation between 2006 and 2007. In Spain, NEO invested 126.0m, out of which some 44m were spent at the end of construction works of the wind farms that entered into service in the 9M2006, namely Boquerón (22 MW), Belchite (50 MW), La Brújula (73 MW), Loma de Los Aviadores (6 MW) and Ponte Rebordelo (40 MW). Currently, NEO has 422 MW under construction, out of which 217 MW are expected to enter into service until the end of 2006 63 MW in Portugal, 135 MW in Spain and 20 MW in France. Works in progress at NEO amounted to 219m in Sept06.

Iberian Distribution Capex at Iberian distribution business amounted to 201.2m in the 9M2006, mostly targeting the improvement of quality of service at our distribution networks. In Portugal, following the significant investments made in recent years at the distribution grid to improve service quality, Equivalent Interruption Time (EIT) reached for the first time a figure below 2 hours (119 min.) in the 9M2006 (vs. 132 min. in the 9M2005). Note that during the 1Q2006, less favourable weather conditions and an incident at one of EDPD's sub-stations contributed with an additional 21 min. and that excluding this impact, EIT would have decreased 34 min. YoY.

Iberian Gas Capex amounted to 32.5m in the 9M2006, out of which 79% was spent in the expansion of the gas distribution network. The balance is related to the transmission network in Spain, marketing campaigns, new customers meter readings and revamping of facilities from LPG to NG.

Brazil Energias do Brasil capex in euro terms decreased 30.0% YoY, mostly due to the conclusion of construction works at Peixe Angical hydro plant 70.1m in the 9M2006 vs. 184.6m in the 9M2005 which started industrial service in the 3Q2006. A new unit at Mascarenhas hydro plant started operations in October 2006 (50 MW) and until the end of 2006, Energias do Brasil is expecting to bring on stream another 25 MW with the end of the construction of São João hydro plant. In addition the company has already announced the future construction of Santa Fé hydro plant (29 MW), which is expected to start operations in 2009. Out of the 136.6m invested in electricity distribution, 45.6m are related to the mandatory programme of universal connection to all low voltage consumers Universalização, in the concession areas of Bandeirante, Escelsa and Enersul.

Financing of 6.08% of Spanish Tariff Deficit	(153.7)	(165.7)
Tariff Deficit of EDP Distribuição in 2006	(91.5)	
Net financial interest and other financial costs	(348.9)	(213.1)
Dividends paid	(365.6)	(336.0)
Other non-operating changes	(84.1)	(392.6)
Decrease/(Increase) in Net Debt	108.4	(489.6)

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

EDP Group's cash flow in the period enabled a 108.4m reduction in net debt vis-à-vis the YE2005. Such reduction is explained by:

a 23% increase in operating cash flow to 1,523.2m;

576.4m related to the final settlement received in January 2006 from the sale of 14.27% of Galp Energia (80% of 720m), that was divested in the end of 2005;

which was partly offset by:

the payment of the 2005 annual dividend of 365.6m;

the financing by HC Energia of 6.08% from the 9M2006 tariff deficit in the Spanish regulated system (153.7m);

the 62.6m hydro correction payment made to REN during 9M2006 following a dry period (hydro coefficient of 0.65 in the 9M2006);

financial investments of 82.2m, of which 58.7m are related to the reinforcement of EDP's indirect stakes in Portgás and Setgás from 59.6% and 10.1% to 72.0% and 19.8%, respectively;

the full consolidation of Portgás balance sheet in 2006 vis-à-vis the proportional consolidation (59.6%) as at December 2005.

It is worth mentioning that the acquisition of 50% of Bilbogas (35m) and 50% of Gasnalsa (45m), and also the divestment of 46% of Telecable (54m), were not settled yet.

Note:

- (1) Other adjustments include the reversion of the 2005 118.0m negative impact that resulted from the mark-to-market of the derivative instrument contracted to hedge the effect of interest rate changes on the NPV calculation of the value of the CMEC. This reversion reflects the positive impact of the recent increases in interest rates.

Financial Results improvement in the 9M2006 reflect:

A 126.2m increase in **Income from group and associated companies** mostly due to: i) the equity contribution of 30% of REN, which reflects both the recovery in the 9M2006 of previous year's tariff differences and the capital gain on the disposal of its 18.3% stake in Galp; ii) the provisioning of EDP's financial stake in Electra (Cape Verde), related to guarantees granted by EDP on 60% of that company's bank financing; iii) the improvement of Edinfor's results (a net loss of 14.8m in the 9M2005 vs. a net loss of 2.4m in the 9M2006). In addition, in the 9M2006, we fully consolidated Portgás (EDP currently owns 72% of Portgás).

Net financial interests paid increased 14.2% YoY on the back of a 24 b.p. increase in EDP Group's average cost of debt (4.4% in the 9M2006 vs. 4.2% in the 9M2005) due to higher market interest rates and an 8.1% increase in the average level of debt in 9M2006 vs. 9M2005.

The Brazilian Real appreciation against the US Dollar in the 9M2006 (8%) was weaker than in the 9M2005 (19%). The impact on the dollar denominated debt in Brazil of such currency performance drove **Net foreign exchange differences** down 47.1m.

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

The **Other** financial gains and losses in the 9M2006 essentially relate to the fair value of derivatives: i) due to the increase in interest rates, the 118.0m negative impact of the mark-to-market recorded at YE2005, related to the fair value of a derivative contracted by EDP to hedge the effect of interest rate changes on the NPV calculation of the value of CMECs, was fully reverted in the 1H2006 - additionally, we registered a 30m capital gain in the 2Q2006 with this derivative following the increase in interest rates over the life period of this financial instrument; ii) the fair value of other derivatives amounted to an additional + 19.4m in the 9M2006 vs. 9M2005.

Amortization of rights and concession includes a 5.7m cost related to an impairment at Affinis goodwill.

⁽¹⁾ Net Forex Differences in chart were adjusted for hedge instruments accounted in Other Financials

IBERIAN MARKET

Electricity gross demand in the Iberian market posted a 3.2% increase in the 9M2006, with electricity demand in Portugal increasing 3.3% and in Spain 3.1%. Alongside with a steady electricity consumption growth, the Iberian market was characterized by some recovery of the hydro production levels, still below historical average, and an increase in wholesale prices following higher marginal electricity generation costs and an increase of thermal output in Spain.

Regulation in Portugal and Spain grants Special Regime Producers dispatch priority over all other technologies. In 9M2006, SRPs in Iberia represented 19% of gross demand. In Portugal, special regime generation went up by 31% mainly due to a 67% increase in wind farms installed capacity to 1,536 MW. In Spain, special regime generation remained stable, with the installed capacity of wind farms increasing 17% to 10,955 MW.

Regarding conventional regime in Portugal, thermal generation presented a decline vs. 9M2005, as a result of the abovementioned increase in SRP's output and hydroelectric generation, following better hydrological conditions. In Spain, CCGTs output increased 37.7% YoY, following an increase of installed capacity, while electricity output from coal power plants went down by 9.7%.

In 9M2006, CO2 emissions in the Iberian market should have surpassed the amount of free emission allowances granted (2006: 39.0m tons CO2 in Portugal and 174.6m tons CO2 in Spain, including allowances reserved for new entrants), which together with the CO2 rights deficit accumulated in 2005 and the higher average prices of CO2 allowances, specially in the beginning of 2006, influenced a lower utilisation level of the less efficient coal power plants. Nevertheless, CO2 prices in 2006 decreased from 22/ton in the beginning of the year to 13/ton at September.

EDP (for outputs see Annex)

In the 9M2006, the output of EDP's conventional power plants in Iberia decreased 0.9%. The output of the power plants with PPAs decreased 1.9% following a lower utilization of the thermal power plants, as a result of the strong rise of the system SRP's output and the hike in international fuel prices, which was partly compensated by the higher utilization of EDP's hydro plants following improved hydrological conditions. In the liberalised market EDP remained stable at the 14.85 TWh, since the start-up of the Unit III of Ribatejo CCGT in 4Q2005 was offset by the lower availability of EDP's power plants in Spain in 9M2006, following the programmed stoppages in Castejón CCGT (6 weeks) in 1Q06, Aboño 2 (7 weeks) in 2Q06 and Trillo (4 weeks) in 2Q06.

EDP s Generation and Supply scheme in Iberia**GENERATION CONTRACTED UNDER THE PPA REGIME IN PORTUGAL**

65% of EDP s Iberian capacity is bounded to the PPA s low risk profile, providing stability on cash-flows. PPA contracts secure a remuneration based on availability rather than on output, providing a ROA of 8.5% real pre-tax and the pass-through of fuel and CO2 emission costs.

LIBERALISED GENERATION IN PORTUGAL AND SPAIN

Integrated management of the gross profit risk in generation and supply, taking into account generation costs and market demand. Selling energy to wholesale and liberalised retail markets.

In 9M2006, PPAs continue to allow the stability and reliability of wholesale electricity tariffs to the Portuguese electricity system.

Given that 65% of EDP's installed capacity in Iberia operates under long-term Power Purchase Agreements (PPAs), the company's gross profit is largely sheltered from generation output swings and fuel costs hikes.

Gross profit from plants with PPAs increased 0.1% given the stable return profile of the PPA Capacity Charge and the pass-through of fuel costs via the PPA Energy Charge. According to the PPA contracts, CO2 emissions and permits for the bounded power stations are managed by REN, the counterpart of our PPAs, thus do not impact EDP's gross profit. The increase in the PPA Capacity Charge in the period (+2.3%) reflects inflation, the entry into service of Frades (hydro 192MW, which has a PPA contract until 2027) in August 2005 and higher availability factors in the period (km: 1.050 in 9M2006 vs. 1.046 in 9M2005).

The fuel procurement margin (energy charge minus fuel costs) dropped from 22.0m in 9M2005 to 5.4m in 9M2006 mainly as a result of the negative spreads in 9M2006 between EDP's fuel-oil acquisition cost and the international fuel-oil prices indices, which was partly compensated by an increase of the spreads between coal acquisition cost and international coal prices indices (used as benchmarks to calculate the PPA Energy Charge).

In 9M2006, EDP continued the works with the LCPD investment at Sines coal power plant (total amount of 200m to be concluded in 2008, of which 31m already done). It is important to highlight that this investment will be remunerated in accordance with the PPA contract which provides a ROA of 8.5% real pre-tax.

Km = 12 months average verified available capacity / 12 months average contracted available capacity

⁽¹⁾ average fuel costs do not include hydro power plants

⁽¹⁾ Load Factor: number of equivalent hours to the output of a power plant relative to the total number of hours in the period

Output: EDP's output in the Iberian liberalised market was stable vis-à-vis 9M2005. In Portugal, electricity generation increased 41.3% following: i) the start up of Unit III of Ribatejo CCGT in 4Q2005 and the stoppages in unit I and II in 3Q2005; and ii) the better hydrological conditions in the period. In Spain, the 13.1% reduction is explained by a lower availability of EDP's power plants in Spain, following mainly the programmed stoppage in Aboño 2 (536MW) during 7 weeks, in 2Q2006, for the triennial maintenance works and LCPD investments, and the programmed stoppages in Castejón CCGT (6 weeks) in 1Q2006 and Trillo (4 weeks) in 2Q2006.

Gross Profit: In Portugal, gross profit reached 107.2m as a result of: i) an upward revision of the selling price contracted with EDP Comercial (liberalised supply); and ii) the swing from a short-position in generation-supply on the 9M2005 to a long-position on the 9M2006, which enabled the trading activity to manage the electricity needs of the supply activity with own generation, having lower electricity purchases in the Spanish market, which were being made at a higher price than the one contracted with EDP Comercial. In Spain, the 16.9% decrease is explained by: i) the lower generation output (- 56m); and ii) the decrease of the average selling price (- 32m) in the 9M2006 the generation in Spain changed its accounting regarding the electricity sold through bilateral contracts (67%), reflecting the contracted price in revenues instead of the pool price (however this reduction in generation gross margin had the opposite effect on the supply activity); which was partly compensated by lower costs related with CO2 emissions (3m revenue in the 9M2006 vs 23m cost in the 9M2005).

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

Fuel Costs: In Portugal, the average natural gas cost per MWh increased 10.2%, as a result of the hike in the price of Brent, to which the natural gas contracts of Ribatejo CCGT are indexed. In Spain, average fuel costs per MWh increased 1.8% vs. the 9M2005, mainly as a result of a strong increase in the average natural gas price, while average fuel costs of coal power plants fell by 5%.

CO2 Emissions: In Portugal, CO2 emissions amounted to 2.1m tons and were 0.4m tons bellow the emissions free allowances attributable in the period, resulting in a positive impact of 9.2m in 9M2006 gross profit. In Spain, CO2 emissions amounted to 8.8m tons and were 0.5m tons above the emissions free allowances attributable in the period. In the 9M2006 were purchased 0.9m tons of CO2 emission allowances, at an average price of 15/ton, to face the accumulated shortfall until 9M2006 (1.4m tons from 2005 and 0.5m tons from 9M2006). This had a negative impact of 13m in the gross profit. Additionally, the provision related to the insufficiency of CO2 allowances for 2005, was also updated in order to reflect the current market prices for CO2 (13/ton in Set-06 vs. 21/ton in Dec-05) and the purchase of CO2 allowances (0.4m tons) to face the 2005 shortfall. This had a positive impact of 16m in gross margin.

Emploees						
Portugal				1,681	1,701	-20
Spain				592	604	-12
MW / Employee						
Portugal				5.2	4.9	6.0%
Spain				4.2	4.1	2.0%

EBITDA was up 22.4% mostly due to the increase in gross profit, as previously explained. Operating costs went down 1.8% as explained below.

Supplies and services increased 0.7% mostly as a result of higher operating and maintenance costs associated with the increased installed capacity (+392MW Unit III Ribatejo CCGT and +192MW Frades Hydro Power Station, which has a PPA contract until 2027).

Personnel costs decreased 1.4% in the 9M2006, and costs with social benefits decreased 26.4% due to a decrease in pension premiums following the assumptions in the 2006 actuarial study.

SPAIN

In the 9M2006, EBITDA fell 32% affected by the recognition of the price contracted in the bilateral contracts, instead of the pool price (with an opposite effect on the supply activity), and also by the impact of the application of the RD 3/2006.

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

RD 3/2006: The Spanish Government, aiming for a reduction of the tariff deficit for 2006, approved in February 24, 2006, the Royal Decree-Law 3/2006, which modifies the settlement mechanism of the energy sold by generators and purchased by distributors in the pool by the same company, and reconsiders the value of the CO2 emission allowances granted free of charge to the generation companies. In light of HC's interpretation of the current legislation, the total tariff deficit estimated for the period amounts to 2.5bn, of which HC Energia has to finance 6.08% (154m). This was not deducted from revenues considering that the current legislation assures its recovery. Regarding CO2 allowances, EDP booked a 22m provision to cover the potential withdrawal of the CO2 emission allowances granted free of charge for the periods of January and February 2006 (1.5m tons). As from March 3, 2006, according to the interpretation done on the RD 3/2006, only the CO2 emission allowances, which respect to electricity sold in the Spanish pool and not through bilateral contracts, should be deducted from generation revenues. This had a negative impact of 24m in the period between March and September 2006, corresponding to 1.3m tons of CO2 emissions. Since March 2006, HC is selling most of its generation through bilateral contracts to the supply business or through regulated bilateral contracts with the distribution activity.

PORTUGAL

EDP has been revising supply contracts pricing conditions upon maturity given the highly competitive regulated tariffs. This resulted in some client switching to the regulated tariff system. Such switching was also followed by the clients of EDP's competitors.

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

The increase in the supply net selling price (after TPA tariffs) (+13.3%) contributed + 16.6m to gross profit and follows the upward revision of the commercial conditions of client s contracts upon maturity and the capture of new clients with better price conditions.

Electricity purchases are done through a fixed price contract established with EDP s energy management unit. The reference price for this contract was reviewed in 4Q2005 to reflect updated expectations regarding electricity wholesale prices. This upward revision of the electricity cost accounts for 47.2m in gross profit drop in 9M2006.

Other operating costs/(revenues) in the 9M2006 include: i) costs with consumption deviation (- 5.4m); ii) provisions for bad debtors (- 5.0m); and iii) the utilization of provisions to cover margin losses (+ 2.1m) associated with onerous contracts.

As from September 2006, the Portuguese system was fully liberalised, which means that since that date the low voltage clients can choose their liberalised supplier. EDP was the only electricity operator to offer a product to low voltage clients (5D), reaching by the end of the 3Q2006 2,141 low voltage clients.

SPAIN

The strong increase of volumes sold in the Spanish liberalised market, is a result of: i) the 1,500 GWh awarded to HC Energia in the 2006 RENFE s public tender for electricity supply (out of 2,287 GWh); and ii) the launch of a marketing campaign in the beginning of 2006 to promote a dual-fuel offer and an enhanced service proposition to residential clients.

The 43m improvement in the gross profit of the Spanish supply activity is explained by: i) a lower purchase cost note that in the 9M2006 the supply activity in Spain change its accounting regarding the electricity purchased through bilateral contracts, reflecting the contracted price in costs instead of the pool price; and ii) a 15% increase of the average net selling price (after TPA tariffs) following the revision of the commercial conditions of all existing contracts upon maturity and the capture of new clients with higher pricing conditions.

The other operating costs (or revenues) line is explained by the fact that in 9M2006 HC reverted 10m from a provision to cover margin losses in the supply activity.

Table of Contents**Renewable Energies: NEO Energía**

Financial Highlights (m)	9M2006	9M2005	Δ 06/05
Gross Profit	144.1	67.1	114.8%
Operating Costs	39.0	22.6	72.5%
EBITDA	105.1	44.5	136.3%
EBIT	52.2	23.1	125.7%

NEO is EDP Group's division for renewable energies, holding the assets of Enernova (wind farms in Portugal - 100% owned by NEO), Genesa (renewable energies in Spain - 80% owned by NEO and 20% owned by Caja Madrid) and Desa (wind farms in Spain - acquired in Dec05 and 100% owned by NEO).

EDP has been investing substantially in renewable energies. In 2005, EDP acquired: i) wind farms from Tecneira, in Portugal - with 50 MW in operation and close to 70 MW in the pipeline until 2007; ii) the Ortiga and Safra/Coentral wind farms, in Portugal - Ortiga (12 MW) started operations in Jun 2006 and another 42 MW are in the pipeline until 2007; iii) Desa, in Spain - with 274 MW ⁽¹⁾ in operation and close to 1,190 MW in the pipeline until 2010; iv) Ider in Spain with 114 MW under development and to start operations until 2007 and v) Weom in France with 30 MW under development, which are expected to enter into operation until the end of 2007.

On October, EDP reinforced the visibility of its wind generation pipeline, as the consortium Eólicas de Portugal, in which EDP has a 40% stake, won the Portuguese tender for the construction of some 1,200 MW of wind capacity (expected to come on stream between 2009 and 2012).

As of September 2006, NEO had a **total gross installed wind capacity of 1,237 MW**. An additional 422 MW are currently under construction, out of which 217 MW are expected to enter into operation until the end of 2006 - 63 in Portugal, 135 MW in Spain and 20 MW in France reaching 1,454MW by the end of 2006, fully in line with the targets previously announced.

Gross profit & EBITDA benefited from the acquisitions (Desa - 224 MW and wind farms from Tecneira - 50 MW), organic growth both in Portugal (66 MW) and Spain (191 MW) and from higher wind energy prices.

Total **239** **139** **+ 100**

By the end of September 2006, NEO's consolidated installed capacity in Iberia totalled 1,028 MW, out of which 943 MW of wind (261 MW in Portugal and 681 in Spain). In Portugal, last year's acquisition from Tecneira (50 MW in operation), the re-powering of Pena Suar (6 MW - Dec05) wind farm, and the entry into service of Ortiga (12 MW - Jun06), Abogalheira (3 MW - Sep06), Serra d'el Rei (22 MW - Sep06), Sobral (8MW - Sep06), Arruda 1 (6 MW - Sep06) and Pó (9MW - Sep06) wind farms, allowed NEO to increase its installed capacity by 116 MW YoY. In Spain, wind installed capacity increased 415 MW on the back of last year's acquisition of Desa (224 MW in operation) and the entry into operation of Boquerón (22 MW - Jan06), Belchite (50 MW - Jan06), La Brújula (73 MW - Jun06), Loma de Los Aviadores (6 MW - Ago06) and Ponte Rebordelo (40 MW - Sep06) wind farms.

NEO's electricity emissions from renewable sources in Iberia totalled 1,573 GWh in the 9M2006, up 79.6% YoY, on the back of the additional capacity that was brought on stream, but also as a result of an increase in the number of equivalent service hours at our Iberian wind farms to 1,632 hours in the 9M2006 from 1,527 hours in the 9M2005 (load factor up to 25% from 23%). In Portugal, under the existing framework, a decrease in load factors does not reflect in lower tariffs, as these only decrease with higher load factors and solely for wind farms licensed before Feb06. This lowers the return sensitivity of Portuguese wind farms to load factors when compared to Spanish wind farms, for which higher load factors directly translate in higher returns.

Gross profit more than doubled benefiting from the increase in both installed capacity and load factors as well as from the higher average selling prices of the energy produced by our Iberian wind farms. In the 9M2006, the energy produced by our Portuguese and Spanish wind farms was sold at an average of 95/MWh and 93/MWh respectively, which compares with average prices of 92/MWh and 73/MWh, respectively in the 9M2005.

Consolidated Installed Capacity (MW)	9M2006	9M2005	Δ 06/05
Wind	943	412	+531
o/w in Portugal	261	145	+116
o/w in Spain	681	266	+415

Waste	79	69	+9
Small Hydro	3	3	
Total	1,028	491	+537

Electricity Generation (GWh)	9M2006	9M2005	Δ 06/05
Wind in Portugal	312	227	37.3%
Wind in Spain	989	357	176.9%
Biomass	7	14	-51.7%
Waste	265	273	-3.2%
Small Hydro	1	5	-68.0%
Total	1,573	876	79.6%

Gross Profit (m)	9M2006	9M2005	Δ 06/05
Wind in Portugal	31.8	20.9	52.1%
Wind in Spain	96.6	27.5	
Waste & Biomass	12.7	15.2	-16.6%
Small Hydro	0.11	0.31	
Others & Consolidation Adjustments	3.0	3.2	-5.8%
Total	144.1	67.1	114.8%

Supplies & Services increased 7.0m YoY, reflecting: i) an additional 3.9m from the first time consolidation of Desa in 2006; and ii) a 2.7m increase in O&M costs (S&S) with the maintenance of existing wind farms. Personnel costs increased 4.0m YoY due to both salary increases and an increase in the number of employees (76 employees from the acquisition of Desa).

All in all, EBITDA improved from 44.5m in the 9M2005 to 105.1m in the 9M2006, which represents a 57.3% EBITDA margin, up 8.3 p.p. YoY. In the 9M2006, excluding Small Hydro and Waste & Biomass businesses, which presented EBITDA margins of 46.0% and 13.4%, respectively, EBITDA from wind energy in Portugal and Spain reached 24.8m and 81.8m, respectively (or 83.1% and 80.7% in terms of revenues).

Depreciations rose from 21.5m in the 9M2005 to 53.9m in the 9M2006 mostly due to the previously mentioned increase in NEO s installed capacity.

Load Factor: number of equivalent hours to the output of a wind farm relative to the total number of hours in the period, considering the date on entry into industrial service of each wind farm

Table of Contents**Distribution in Iberia**

Financial Highlights (m)	9M2006	9M2005	Δ 06/05
Gross Profit	989.8	942.0	5.1%
Operating Costs	583.0	592.2	-1.6%
EBITDA	406.8	349.8	16.3%
EBIT	199.3	137.3	45.2%

EDP Group's Distribution activity in Iberia comprises EDP Distribuição, the Group's subsidiary for electricity distribution and supply to the regulated system in Portugal, and HC Energía's distribution company in the Spanish electricity market.

In the 9M2006, EDP Group distribution companies supplied electricity to some 6.5 million clients in the Iberian regulated system.

Gross profit from EDP Group's distribution activity in Iberia increased 5.1% YoY:

(a) in Portugal, allowed revenues increased 10% YoY while electricity gross profit increased 4.2%, reflecting into a 126.9m tariff difference to recover (compared with 70.7m in the 9M2005) out of that tariff difference, 73.9m result from higher costs with energy purchases while the balance is mostly explained by the transfer of MV/SLV clients from the liberalised market back to the regulated tariff (for further detail, see page 23).

(b) in Spain, gross profit reflects: i) a 2.1m increase in the electricity regulated revenues; and ii) a 14.7m positive impact from deviations on the cost of electricity purchased, as the average purchase cost of our distribution company in Spain was lower than that of the distribution companies in the system, which is the one recognized for regulatory liquidations. Since June 2006, volumes being traded in secondary markets, at higher prices than the daily market increased significantly, thus creating costs deviations among the distribution companies, due to their bidding strategies.

In Portugal: i) in 2005, the unanticipated rise in fuel costs and special regime generation volumes led to a significant increase in the system's costs; and ii) in 2006, ERSE decided to review the allocation criteria, among electricity clients, of the burden resulting from higher production costs with renewable energies. These two events, along with the fact that 2006 increases in LV clients' tariffs were limited to inflation, created a tariff deficit of 399m, of which approximately 125 million was attributed to EDPD. Nevertheless, and due to the Government's recognition of the right to receive this tariff deficit in a period that might range between 3 to 10 years, EDPD booked in its 9M2006 electricity revenues about 3/4 this tariff deficit (91m) and accounted it as an asset. We are expecting the Portuguese Government to release the legal support that will define the conditions upon which EDPD will be able to recover this tariff deficit. If such legal support is not released until the end of the year, EDP will have to revert from its accounts the recognition of the right to receive this tariff deficit.

On October 16th, 2006, ERSE proposed a 12.4% average increase for electricity tariffs in Portugal next year, along with the recovery of the 2006 tariff deficit in three years time. However, the Portuguese Government showed publicly its intention to limit 2007 average tariff increase to 6%, namely through the extension of the 2006 tariff deficit recovery period from 3 to 10 years. ERSE proposal is currently being discussed by the Tariff Council and ERSE should come out with a final decision until December 15th.

Table of Contents**Distribution in Portugal**

Electricity Consumers (thousand)	9M2006	9M2005	Δ 06/05
Regulated	5,954.6	5,871.7	82.9
Non-regulated	11.4	12.9	-1.5

Electricity Revenues	3,157.1	2,775.7	13.7%
Electricity Purchases	2,283.3	1,937.0	17.9%
Electricity Gross Profit	873.8	838.7	4.2%
Total Allowed Revenues	1,000.8	909.4	10.0%
Tariff Difference to Recover/(Return)	126.9	70.7	

In the 9M2006, electricity distributed increased 4.7% YoY, to 33.8 TWh. HV and MV segments benefited from the co-generators' consumption from the regulated system (+1.1 p.p.) as they opted to sell to the system all the energy they produced at special regime's prices, thus benefiting from the tariff differential between the two regimes. Excluding the impact from co-generators' consumption as well as the temperature (-0.1 p.p.) and working days (+0.1 p.p.) effects, consumption would have increased 3.6%.

The number of clients purchasing electricity in the liberalised market decreased 11.8% YoY, reflecting the transfer of some MV and SLV clients back to the regulated tariff, following an increase of electricity prices in the liberalised market for these voltage levels. As a result, electricity sales in the liberalised market decreased 16.4% YoY, to 5.8 TWh in the 9M2006.

EDPD's allowed revenues increased 10% YoY:

a) The Use of the Distribution Grid (UDGr) revenues increased 6.4% on the back of higher electricity-flow into EDPD's network. Note that during the 2006 Tariff Review, ERSE changed the calculation formula of the UDGr activity allowed revenues by introducing a fixed component (€ 302m in the 9M2006), independent of electricity distributed volumes, thus reducing EDPD's risk exposure to deviations of electricity demand in Portugal.

Regulated Revenues (€ m)	9M2006	9M2005	Δ 06/05
Fixed component of the UDGr: HV and MV (€ m)	102.3		
Unit revenue for the UDGr: HV and MV (€/MWh)	5.6	8.3	-32.3%

Fixed component of the UDGr: LV (€ m)	199.7		
Unit revenue for the UDGr: LV (€/MWh)	13.6	24.5	-44.4%
Electricity delivered to BES/NBES: LV (GWh)	17,998	17,330	3.9%
UDGr allowed revenues	736.6	692.2	6.4%

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

Average assets of the NS activity (net of amortisations)	246.2	277.7	-11.3%
Annual Return on average assets of NS activity (%)	8.0	8.5	-5.9%
Assets amortisation of NS activity	32.6	35.7	-8.8%
Annual structural commercial costs of NS activity	53.3	43.9	21.3%
Network Supply allowed revenues	100.7	97.4	3.4%
Average assets of SPS activity (net of amortisations)	15.9	49.0	-67.5%
Annual Return on average assets of SPS activity (%)	8.0	8.5	-5.9%
Assets amortisation of SPS activity	1.6	4.9	-67.8%
Annual structural commercial costs of SPS activity	50.4	50.7	-0.5%
Supply in Public System allowed revenues	52.9	58.7	-9.8%
t-2 tariff adjust. for UDGr, SPS and NS	27.5	12.2	125.2%
t-1 & t-2 tariff adjust. for Energy Aquisition activity	64.9	20.7	213.7%
HR Restructuring Costs Recovery	18.1	28.3	-36.1%
Total Allowed Revenues	1,000.8	909.4	10.0%

b) Allowed revenues for the Network Supply (NS) and the Supply in the Public System (SPS) activities reflect: i) a 50bp decrease in the regulated rate of return for these activities and ii) a lower regulated asset base, which followed the transfer of some assets to EDP Soluções Comerciais, a company created in 2005 to manage the commercial systems, to supply commercial services to EDPD and EDPC, and to allow the capture of synergies within the supply activities as well as a tight control over commercial costs in an increasingly liberalised environment. ERSE accepted as part of EDPD's controllable costs the remuneration and depreciation of such assets, which reflected into a 9.7% increase in structural commercial costs for the NS and SPS activities.

c) Allowed Revenues for the 9M2006 also include 92.4m related to the recovery of previous years' costs and 18.1m from the recovery of costs incurred within the scope of the EDPD's Human Resources Restructuring Programme (HRRP).

Costs with electricity purchases rose 17.9% year-on-year as a result of: i) a 3.4% increase in electricity delivered to the distribution grid; ii) an increase in energy acquisition from Special Regime Producers; iii) higher average fuel costs and iv) an increase in the average Global Use of the System tariff.

Depreciation and amortization	252.1	250.0	0.8%
Compensation of subsidised assets depreciation	(62.0)	(59.6)	-3.9%
EBIT	180.1	127.2	41.6%
EBIT / Revenues	5.7%	4.5%	1.1pp
Number of Employees	9M2006	9M2005	Δ 06/05
Number of Employees	5,257	5,435	-178
GWh / Employee	6.43	5.94	8.3%
Clients / Employee	1,133	1,080	4.8%

Electricity gross profit for the 9M2006 came 126.9m below allowed revenues, of which;

a) 73.9m result from higher costs with energy purchases: i) 33.9m relate to lower energy purchases from special regime producers than ERSE's forecasts when setting 2006 tariffs, implying that EDPD has to recover part of the fixed component of electricity purchases related to special regime production that was charged by REN, while the company had to satisfy consumption through energy purchases from the binding system; and ii) 39.9m result from the fact that ERSE did not anticipate the increase in regulated consumption that followed the transfer of MV/SLV clients from the liberalised market back to the regulated system, implying that this increase in consumption had to be satisfied through higher energy purchases, namely from the non-regulated system (parcela livre), none of them considered in the 2006 tariff review;

b) the balance is mostly explained by the fact that the MV/SLV clients that are coming back to the regulated tariff are charged lower average electricity tariffs, thus not allowing the immediate pass-through of all electricity acquisition costs that the company supports to satisfy this additional consumption.

Supplies and services decreased 4.2% YoY as a result of: i) a 13.8m decrease in commercial costs due to both lower set-up costs (4.6m in the 9M2005 related to the re-branding of EDPD's commercial network) and lower billing and posting expenses due to, on the one hand, an increasing adherence to conta certa, as the number of clients choosing this billing system (upon which clients are charged a fixed monthly amount) increased 45% YoY to 1.6 million (vs. 1.1 million in Set05), and on the other, to the fact that, in 2006, the company started invoicing every two months instead of monthly; and ii) a 4.5m decrease in IT costs, which were partly compensated by iii) a 10.4m increase in costs with support services, of which 3.2m in management fees from EDP S.A. and EDP Valor and 4.4m in professional coaching, while the balance mostly relates to communication and insurance premiums.

The number of employees was reduced by 178 between the 9M2005 and the 9M2006. This reduction was achieved through the 2005 HR Restructuring Programme (119 employees Dec 2005) and the achievement of 60 retirements and early retirements during the 9M2006.

Personnel costs decreased 3.2% YoY due to the accounting of an 9.2m one-off expense in the 9M2005. Excluding this one-off as well as personnel costs capitalization and severance payments, personnel costs increased 2.6% YoY, following a 2.7% average salary increase in 2006

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

and an increase in bonuses paid, both more than compensating the positive impact of savings achieved through personnel reduction.

Costs with social benefits fell 15.7m on the back of: i) the accounting in the 9M2005 of a 10.1m cost related to an increase in Pension Fund provisions; and ii) a 7.3m decrease in pension premiums due to an expected increase of the return on Pension Fund's assets (6.4% in 2005 vs. 7.5% in 2006), which was partly compensated by iii) a 1.8m increase in Retirement Premiums.

⁽¹⁾ Normalized EBITDA (i.e. excluding tariff differences, t-2 and t-1 tariff adjustments and HR restructuring costs recovery) is 403.3m for the 9M2006 and 323.5m for the 9M2005

Table of Contents**Distribution in Spain**

Income Statement (m)	9M2006	9M2005	Δ 06/05

Depreciation and amortization	19.1	23.6	-19.4%
Compensation of subsidised assets depreciation	(1.6)	(1.5)	-12.8%
EBIT	19.2	10.1	90.7%
EBIT / Revenues	12.0%	9.0%	3.0p.p.

EBITDA of the Spanish Distribution activity increased 13.5% following: i) an increase in the remuneration for the regulated activities recognised in the 2006 tariff (+ 2.1m); ii) a positive impact of deviations on the cost of electricity purchased (+ 14.7m); and iii) the negative impact of the application of the RD 3/2006, according to its interpretation (- 15.5m now accounted as other costs and revenues instead as direct activity costs);

i) regarding the regulated revenues, according to the RD 1556/2005 that sets the revenues for the Spanish regulated activities for 2006, of the 3,016.7m attributed to the electricity distribution activity, 96.1m or 3.2% were allocated to our Spanish Distribution activity;

ii) the distribution activity gained an extra revenue of 14.7m because its average purchase cost was lower than the average purchase costs of the distribution companies in the system, which is the one recognised in the regulatory liquidations. Since June 2006, there was a substantial increase of the volumes traded in secondary markets, at higher prices than the daily market, creating cost deviations among other distribution companies in the system, due to their bidding strategies;

iii) the RD 3/2006 approved in February 24, 2006, considers that as of March 2006, the generation sales and the distribution purchases of electricity, made simultaneously and within the same group, are netted and priced at a provisional 42.35/MWh (average generation cost of the conventional regime included in the 2006 tariff). HC's distribution purchases that were netted against its own generation amounted to 1,115 GWh. The impact of this measure (- 15.5m) is accounted in the distribution business, as the difference between the acquisition price of this electricity and the 42.35/MWh. According to the RD the final settlement price should be adjusted before year-end to reflect transparent and objective prices of electricity markets.

EDP gas assets in Iberia, are concentrated in the regulated distribution activity, where it has a market share of 7⁽¹⁾ and a total number of clients of approximately 790,000. Naturgas is increasing its position in the liberalised market in Spain. EDP's assets comprise the Spanish company Naturgas (56.2% controlled by EDP, through HC Energia) and the Portuguese gas distribution companies Portgás (72.0%; fully consolidated) and Setgás (19.8%; equity consolidated).

In April 2006, EDP concluded the reinforcement of its stakes in Portgás from 59.6% to 72.0% and Setgás from 10.1% to 19.8%, respectively, after the non-opposition by the Portuguese Competition Authority to the acquisition by EDP of Endesa's indirect holdings in these companies. Such operation strengthened EDP's foothold on the Portuguese gas market where it expects to increase its client base upon liberalisation. In May 2006, Naturgas concluded the acquisition of the remaining 50% of Bilbogás's share capital, following regulatory approval, and in September 2006, Naturgas signed an agreement to acquire the remaining 50% of Gasnalsa's share capital. These acquisitions represent an important step towards the consolidation of Naturgas as an integrated energy operator and market leader in the Basque Country's gas market.

In Spain, through Naturgas, EDP changed its commercial branding and launched a strong marketing campaign to promote a dual-fuel offer and to capture new clients in the liberalised market. The strong increase in clients (+117,211) and in volumes (+1,751 GWh) reflects the success attained by Naturgas, from this marketing effort.

In 1Q2006, the liberalised market activity of Naturgas was affected by an exceptional necessity to acquire gas in the spot market at higher prices than those foreseen under the company's current sourcing contracts. This led to an additional non-recurring cost of 15m which had a negative impact on Naturgas' gross margin in 1Q06.

⁽¹⁾ Excluding gas distributed to the electricity sector

In the Spanish Gas activity, the regulated revenues represent more than 80% of this activity gross profit, which provides stability on cash flows. The performance of this activity gross profit is explained by the following factors:

- i) a 7.3% increase in regulated revenues mainly as a result of the acquisition of the remaining 50% of Bilbogás share capital by Naturgas and its full consolidation since Jan-2006;
- ii) higher volumes of gas sold to liberalised clients with better selling price conditions vis-à-vis the cost of Naturgas sourcing contracts (+ 19m). This is the result of (a) the success attained by Naturgas on a dual-fuel offer launched in mid 2005 to small clients, which also enabled the company to secure clients that switched from the regulated system to the non-regulated market, and (b) a renegotiation on better terms of the existing contracts with B2B clients;
- iii) an insufficiency of gas sourcing in the beginning of 2006 led to exceptional procurement costs resulting from gas acquisition made in the spot market at higher prices than those of current sourcing contracts. This had a negative impact of 15m in the gross profit, which was already reflected in 1Q2006 figures;

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

Operating costs increased 27.9% following: i) an increase of 11.2% in supplies and services mainly due to the full consolidation of Bilbogas and higher rental fees; and ii) an increase in the other costs line mainly due to higher local taxes following higher gas sales (+ 2.3m) and an increase of provisions for doubtful clients (+ 1.4m).

Total Gas Distributed	1,499	1,400	7.1%

Ending September 2005, EDP signed a contract with Endesa to reinforce its shareholding in Portgás to 72%. This operation was approved by the Portuguese Competition Authority in April 2006.

The volume of gas distributed by Portgás rose 7.1% to 1,499 GWh at the end of nine months of 2006, from 1,400 GWh in 2005. Services and industrial were the segments that contributed mostly to this increase with an increase of 12.6% and 8.7% respectively.

Gas revenues amounted to 69.0m of which 64.9m relate to natural gas (NG) and 4.1m to liquefied petroleum gas (LPG) an increase of 24.4% year-on-year. This reflects the increase in the unit selling price as well as in the volumes of gas distributed. As a result, gross profit increased 8.6% to 32.7m and EBITDA grew 8.7% to 24.1m by the end of the nine months of 2006.

In September 2006, the Portuguese Regulator (ERSE) approved the new regulatory framework for the gas sector in order to prepare it to the liberalization process. The gas distribution activity will be remunerated under a regulated asset base (RAB) times return on assets (ROA) methodology. However, the parameters (RAB and ROA) associated to this new regulation are not yet defined and will only be release during 2007, to be implemented from 2H2008 onwards.

EBIT	236.1	224.0	5.4%

EDP's activities in Brazil, through Energias do Brasil (owned 62.4% by EDP), were positively impacted in 3Q06 by the start-up of Peixe Angical hydro power plant (452 MW). However, in 9M06 the results were impacted for non-recurrent figures regarding the lay-offs in the redundancy plan (one step of the Vanguarda Project) and tariff readjustments process of our DisCos mainly in Bandeirante. Nevertheless EDP benefited from the strong appreciation of the Real against the Euro, from an average BRL/Euro rate of 3.14 in the 9M05 to 2.71 in the 9M06 (41m at the EBITDA level).

The growth in the distributed volumes was not entirely reflected in the gross profit, because the distribution companies incurred in higher non-controllable costs than the recognised in the tariffs (R\$174m in the 9M2006 vs. - R\$47m in the 9M2005). Such difference is going to be recovered in the next years tariff readjustments processes.

The high increase of generation volumes is explained by the effect of the unbundling process of the generation activities embedded in the DisCos and the start of commercial operation of Peixe Angical Hydro Power Plant. It is important to highlight that Peixe Angical hydro power plant is fully operational since September 2006. The first unit started to work in June, the second unit in August and the last one in September.

Electricity volumes sold to liberalized customers showed a strong growth, capturing the ones that are switching from the regulated market to the liberalised market.

Operating costs were mainly affected by one off costs with the implementation of corporate programmes in order to increase the company efficiency levels, namely the Vanguarda Project and the programme to reduce commercial and technical losses in the distribution grid.

Notes:

Part A: Non-controllable costs, which is a pass-through to the tariff

Part B: Controllable costs, depreciation and return on invested capital, which are updated to inflation (IGP-M) and adjusted by an X factor.

Readjustment Index: Gives the total increase to be applied to electricity base revenues Financial Items: Recovery (or return) of past costs (or revenues) for a period of 12 months.

⁽¹⁾ Part B for Bandeirante was adjusted due to change applied by ANEEL in the consideration of the federal taxes in the construction of the tariff, which now are paid directly by the clients and do not need tariff coverage.

The gross profit of the DisCos decreased 5.3% penalised by negative tariff deviations of R\$174m (vs. R\$47m positive in 1H05), although these will be recovered in the next tariff annual adjustments which mean that adjusted by these deviations, electricity base margin would increase in a

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

normalized base by 21%. This negative difference offset the consumption growth (3.6%) occurred in the 9M2006.

Total electricity distributed by Energias do Brasil increased 3.6% YoY following the increase of the residential customers. However, each concession area was affected by different factors: Bandeirante's consumption growth also benefited from a higher number of clients, while Escelsa's consumption increase was mainly supported on the good economic growth in the region which implied a higher number of clients (industrial and residential). Regarding Enersul, the rural local economy was affected by the foot and mouth disease and an average temperature below normal. However in 3Q06, there were already signs of recovery with electricity consumption growing by 2.6% YoY versus the 2.7% decrease in 1H06.

Bandeirante: Electricity Base Margin decreased 7.8% explained by i) a R\$58m negative difference between the non-controllable costs incurred and the ones covered by the tariff (R\$38m positive in 9M05). Such difference will be pass-through to tariffs in future tariff readjustments. This effect was partly offset by higher volumes distributed and an increase in the implied average unit margin (Part B) given by the regulator. Regarding the tariff adjustments under recovery (or return) in period, it is important to note that Bandeirante is giving back to the tariffs R\$102m between October 2005 and 2006 (reflecting the amendment applied to the October 2003 tariff increase), and at the same time recovering past costs that were not covered by the tariff. In October 20, the Brazilian electricity regulator, ANEEL, approved a 13.44% annual tariff readjustment index for Bandeirante, for the period from October 2006 to Sept 2007, which should support the narrowing of the current tariff deviations over the next quarter

Escelsa: Electricity Base Margin decreased 0.5% due to a strong consumption which was offset by i) increase a R\$98m negative difference between the non-controllable costs incurred and the ones covered by the tariff (R\$5m positive in 9M05); and ii) the impact of the unbundling process. Regarding the tariff adjustments under recovery in the period, Escelsa recovered, between August 2005 and August 2006 i) R\$35m related to past non-controllable cost that were not covered by the tariff; and ii) R\$17m as a retroactive related to the amendment of the August 2004 tariff increase (from 4.96% to 8.58%). In August 2006, ANEEL announced that Escelsa is recovering between August 2006 and 2007 R\$109m related to past costs that were not covered by the tariff.

Enersul: Electricity Base Margin increased 3.2% following i) an increase in the implied average unit margin (Part B) given by the regulator which was partly offset by; i) a decrease in consumption and ii) a R\$18m negative difference between the non-controllable costs incurred and the ones covered by the tariff (R\$4m positive in 9M2005). Regarding the tariff adjustments, Enersul is recovering between April 2006 and 2007 R\$48m related to past costs that were not covered by the tariff.

Table of Contents**Brazil: Generation and Supply****Generation**

Enerpeixe	1,283	0	
Energest	1,196	762	57.1%
Total	3,392	1,641	107%

In September 2006, Peixe Angical hydro power plant located at the state of Tocantins started-up. 100% of the annual 2,374 GWh output is already contracted through PPAs with the regulated distribution companies at an average price of approximately R\$120/MWh (these contracts were already accepted by the regulator). The start of the commercial operation contributed with R\$77m to the gross profit growth in the period.

In the middle of 2005, Energias do Brasil unbundled the generation activities embedded in its distribution subsidiaries, in order to comply with the new regulatory framework for the Brazilian electricity sector. As a consequence, the power plants formerly embedded in the distribution companies (281 MW; of which 14 MW were decommissioned in YE2005) were incorporated in the electricity generation division. This change was another driver of the strong gross profit growth, contributing with R\$33.6m in the period.

At present, Energias do Brasil has an installed capacity of 1.018 MW, and expects to increase its installed capacity by an additional 25 MW - São João until the end of the year.

Subsequent Events: In the beginning of October 2006, the fourth engine of Mascarenhas Hydro Power Plant (50 MW) started-up. Until Dec/2007, the fourth engine will work in a free contract environment and from Jan 2008 until Dec 2037, the output is already contracted through auction at R\$ 115.98 (Dec05).

Trading and Supply

Total	5,132	4,688	9.5%

Volumes sold by our trading and supply company, Enertrade, increased 9.5%, following higher number of clients and the subsequent volumes increase.

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

During the last months, Enertrade was able to capture clients of Energias do Brasil DisCos that are switching from the regulated market to the free market, securing Energias do Brasil's client base. Volumes supplied to final clients increased 53% YoY.

Volumes traded to Energias do Brasil's distribution subsidiaries decreased 51%, since the new regulatory framework does not allow the trading of electricity through self-dealing (companies within the same group). Therefore, self-dealing contracts cannot be renegotiated upon maturity.

Overall, despite the increase in volumes sold, gross profit of Enertrade decreased 19.1% as a result of the end of some self-dealing contracts, which was not completely offset by the new contracts with final clients at a lower margin.

In 9M2006, EBITDA of Energias do Brasil decreased 5.7% following the negative contribution of the distribution and supply activity, that was offset by the increase of the EBITDA in the generation activity in 113%, as a result of the unbundling process and the start-up of Peixe Angical hydro plant. The EBITDA of distribution was affected by negative tariff deviations (R\$174m in 9M06 vs - R\$47m in 9M05). The EBITDA of liberalized supply decreased 23.2% following the end of self-dealing contracts.

Operating costs of Energias do Brasil increased 16.2% explained by:

i) a rise in personnel costs, which mainly reflects (a) one-off provision of expects total costs related to lay-offs in the redundancy plan (R\$52m). The Redundancy Plan (RP), one of the steps in the Vanguard Project, intends to adjust the company's human resources. The number of acceptances to the RP totalled 651 employees (19% of the Group's current number of employees) and considering the necessary replacements, it will imply a net number of lay-offs close to 16% by the end of 2007. The implementation of this programme in the 1H2006 implied that the number of employees in the 9M2006 decreased 378 YoY and (b) the annual average salary rise of 7%;

ii) higher costs with supplies and services, as a result of the programme to contain commercial and technical losses in the distribution grid including higher network inspections and meter reading costs to reduce commercial and network losses (R\$13.1m). In order to reduce the commercial and technical losses of the distribution grid, Energias do Brasil is investing in a specific programme focused on improvements in

Edgar Filing: EDP ENERGIAS DE PORTUGAL SA - Form 6-K

metering procedures, inspections of consuming units, fraud detection and the regularization of clandestine connections. Improvements in the losses indicators are expected towards the end of 2006;
